

Organizations, Roles & Billing Plan

How paid organizations, seats, roles, and plan tiers are meant to work — agreed direction for the next phase of work, not yet implemented.

§ WHERE THE CODE STANDS TODAY

Current reality, so this plan reads against what actually exists — not what the setup docs describe as finished.

- The public catalog works with zero setup — no login, no database. That's the logged-out experience.
- Sign-up, sign-in, and the workspace flow already work end-to-end: creating a workspace makes you its `owner`, you can invite people as `admin` or `member`, and they can accept.
- Exactly **one** real organization exists — "Codestash" — created by a direct database insert rather than the normal signup flow. That bypass is what caused the earlier drag-and-drop bug: the normal flow auto-creates a membership row for the creator, a raw insert doesn't.
- Categories can be dragged/reordered for any workspace with categories seeded in the database — but there's still **no UI to create a category**. Codestash is the only workspace that's been seeded, by hand.
- An `organization.plan` field already exists, defaulting to `"free"` — groundwork for this exact conversation, but nothing reads it yet. It does nothing today.
- Platform superadmin status is a manual, one-time, no-UI step today — not self-serve, not tied to any organization.
- Snippets (hooks / helpers / blocks / AI instructions) have a database table and are migrated in, but nothing reads from it yet — the live site still serves that content from static files.

§ THE PLAN

Five decisions, in order of how they build on each other.

1 Platform superadmin UNCHANGED

One role above every organization, already wired via better-auth's admin plugin. **New rule:** only a superadmin can delete an organization — not even an org's own owner can. This is a change from better-auth's default, where an owner can delete their own org.

2 Organization = paying customer UNCHANGED

Paying is the event that creates an organization. The first payer becomes that org's owner/manager.

3 Org Plan — Dial A THREE PLANS, PRICED PER SEAT

Three plans: **A** (premium, most features), **B** (middle), **C** (cheapest, fewest features). Each scales with seat count rather than a flat price. Controls whole-org feature ceilings — categories, custom backgrounds/icons, invite count, and similar; the exact feature-to-plan mapping is still open.

PLAN A — SEAT PRICING

SEATS	PRICE
1	\$10
2	\$18
3	\$25
4th and beyond	+\$7 each

Plan C: same shaped curve, cheaper throughout. **TBD — exact numbers** for both B and C.

4 Org Role — Dial B INDEPENDENT OF PLAN, 3 LEVELS

Governs what one person can personally do inside an org (invite, edit vs. view-only) — has nothing to do with which plan the org is on.

1 Organization Manager — the owner, full oversight

2 **TBD** — placeholder level

3 **TBD** — placeholder level

5 Free / no-org users CONFIRMED

An invited person isn't really "in" until they sign up through the invite link and create an account — that's what turns "invited" into "can edit / can view / whatever their role allows." Someone who never pays and is never invited never gets an organization at all.

§ WHAT'S MISSING TO MAKE THIS REAL

Only what's load-bearing — not every detail, just what blocks the rest.

☐ An actual payment processor.

Nothing charges anyone anything today. "Paying creates an org" has no engine behind it — needs a real biller (Stripe is the standard choice) to handle checkout, per-seat math, renewals, and card failures.

☐ **A single source of truth for what each plan includes.**

The plan field exists but nothing checks it. Before any feature can be plan-gated, there needs to be one clear list of what each plan includes, and every gated feature has to check against it. Doesn't exist yet, not even as a draft.

☐ **Seat counting and enforcement.**

If pricing is per-seat, something needs to compare how many people are actually in an org against what they're paying for — otherwise a 1-seat plan could invite 10 people for free.

☐ **Actual permission checks for the org roles.**

Today the only role-based restrictions that exist at all are better-auth's built-in ones. Nothing in this app's own code checks role for anything — not category reordering, nothing. The 2 extra role levels won't restrict anything on their own; whatever they're meant to gate has to be coded in explicitly.

☐ **The "create a workspace" flow needs to change shape.**

Today it's just typing a name. Under this plan it becomes picking a plan (A/B/C) and paying for it — a materially bigger flow than what exists now.
